TITLE: Remarks on the investigation of neutron magnon scattering

SOURCE: *Nukleonika*, v. 9, no. 11-12, 1964, 839-846

TOPIC TAGS: neutron scattering, ¹⁹neutron, particle scatter

Abstract: The article describes the construction of an ideal scatterer surface by the mathematical solution of conservation equations in the digital approximation of the dispersion relation. The method is based on the use of a regular grid and a regular lattice.

ing pattern is obtained under real conditions by using a monochromator and an analyzer. The movements of the monochromator spot, the analyzer spot and the tau-vector should be correctly combined. Also the effect of a constant current on the spot should be considered. Result-

TITLE: Neutron investigation of temperature effect in the magnon spectrum of magnetite

SOURCE: Physica status solidi, v. 15, no. 1, 1966, 119-122

TOPIC TAGS: neutron beam, temperature characteristic, magnetite, magnon spectrum

ABSTRACT: The diffuse magnon scattering peaks connected with $\tau_{(111)}$ in magnetite were examined at a number of temperatures using neutrons with $\lambda = 1.314 \text{ \AA}$. The decrease in magnon energies at elevated temperatures was observed and compared with the theory of Mills et al. (R. E. Mills, R. P. Kenan, and F. J. Milford, Phys. Letters (Netherlands) 12, 173 (1964)). A pronounced temperature-dependent asymmetry of the magnon low-energy peak was found. The

"Interference of Attenuated NDV and Poliomelitis Virus in Monolayer HeLa Cell Cultures"

Warsaw, Medycyna Doswiadcza i Mikrobiologia, Vol 23, No 3, 1966, pp 263-270.

Abstract (Authors' English summary): Interference of poliovirus type 2 and NDV strain Reakin was observed in HeLa cell cultures. The interfering factor, in the form of hemagglutinating NDV particles, was purified on a Sephadex G-200 column. Interferon was shown not to be involved in the interference phenomenon in the system studied. The possibility of interference of living attenuated viruses upon mass vaccination of human and animal populations is discussed. Contains 3 Figures, 1 Table and 15 references (3 Polish, 9 "estern and 3 German-language).

Title : Measurement of High Short-Time Pressures with the Aid of Photo-
graphic Emulsion

Orig Pub : Českosl. fiz. zh., 1957, 7, No 3, 367-369

Abstract : To measure pressures during exposures, the plastic deformation of AgBr in photographic emulsion has been used (Referat Zhur Fizika, 1957, No 8, 21571). The film is inserted under a steel cylinder 10 mm in diameter and 50 mm high, the pressure is transmitted with the aid of a steel piston, on which a charge of explosive is placed on the lead liner. During the explosion the film becomes desensitized and the desensitization depends on the pressure. The film is then illuminated, developed, and measured with a microphotometer and an integral objective photometer. The film was calibrated at a static pressure up to 5,000 kg/cm², and the resultant curve was extrapolated to higher pressures. The dependence of the

pressure on the quantity of explosive is shown for three explosives (pentrite, hexogene, and TNT) and the results obtained by this method and by the Kast method are compared.
